Introduction to Streamlit

Streamlit is an open-source Python library that makes it easy to create and share beautiful, interactive data-driven web applications. With just a few lines of Python code, you can create a web application that can be shared with others. Streamlit is designed to be simple and easy to use, so you can focus on your data and not on the underlying web technology.

Streamlit is built on top of Flask, a popular Python web framework. This means that Streamlit applications are web applications that can be hosted on a web server. Streamlit also provides a number of features that make it easy to create interactive web applications, such as the ability to display data in a variety of ways (e.g., as a table, as a chart, or as a map) and the ability to handle user input.

Streamlit is a great choice for creating web applications that need to be shared with others. It is easy to learn and use, and it provides a number of features that make it easy to create interactive web applications. Streamlit is also open-source, so you can modify the code to suit your needs.
